[Demolition Master 3ds Max Thinking Particle Torrent](#)

from those granitic formations; traces of that sand are still found in the rivers Holguin and Escambray, known in general in the vicinity of Villa-Clara, Santo Espiritu, Puerto del Principe,

that at Brazil also the product of the gold washings has fallen, from 1760 to 1820, from 6600 gold kilogrammes to less than 505. (*Per. Nar.*, vol. vi, p. 632). Pepites of gold weighing several pounds, found in our days in Florida and the two Carolinas, prove the primitive wealth of the whole basin of the Antilles, from the island of Cuba to the Monts Apallaches. It is also natural that the product of the gold washings should diminish with greater rapidity than that of the subterraneous working of the veins. No doubt the metals are now no more renewed in the clefts of the veins (by sublimation) that they accumulate in alluvial soil, by the course of the rivers where the table-lands are higher than the level of the surrounding running waters. But in rocks with metalliferous veins, the miner does not at once know all he has to work. He may chance to *lengthen* the labors, to go deep, and to cross other *accompanying veins*. Alluvial soils are generally of small thickness where they are auriferous; they most frequently rest upon sterile rocks. Their superficial position, and their uniformity of composition, facilitates the knowledge of their limits, and accelerates, wherever several workmen can be collected, and where the waters for the washings abound, the total drawing-off of the auriferous clay. These considerations, furnished by the history of the *conquest*, and by the science of the art of the miner, may throw some light on the problem of the metallic wealth of Hayti, which is now agitated. In that island, as well as at Brazil, it would be more profitable to attempt subterraneous workings (on veins) in primitive and intermediary soils, than to renew the gold washings, abandoned in the ages of barbarism, rapine, and carnage.
